

Singapore

	Lighting	Cooling		Equipment	
Product scope	All Lighting	Residential Refrigerators	Room Air Conditioners	Industrial Electric Motors	Distribution Transformers

A summary of the benefits attained from improved energy efficiency through the implementation of Minimum Energy Performance Standards at two levels of ambition (minimum and high). More detailed reports for lighting, cooling and equipment can be downloaded from the United Nations Environment Programme (UNEP) United For Efficiency (U4E) website.

ANNUAL SAVINGS IN 2030*

	Reduce electricity use by over 2.2 TWh which is 4.1% of current national electricity use
	Save electricity worth 430 Million US\$ equivalent to over 1 Power Plant [500MW each]
	Reduce electricity CO ₂ emissions by over 1.1 Million tonnes equivalent to 660 Thousand Passenger Cars

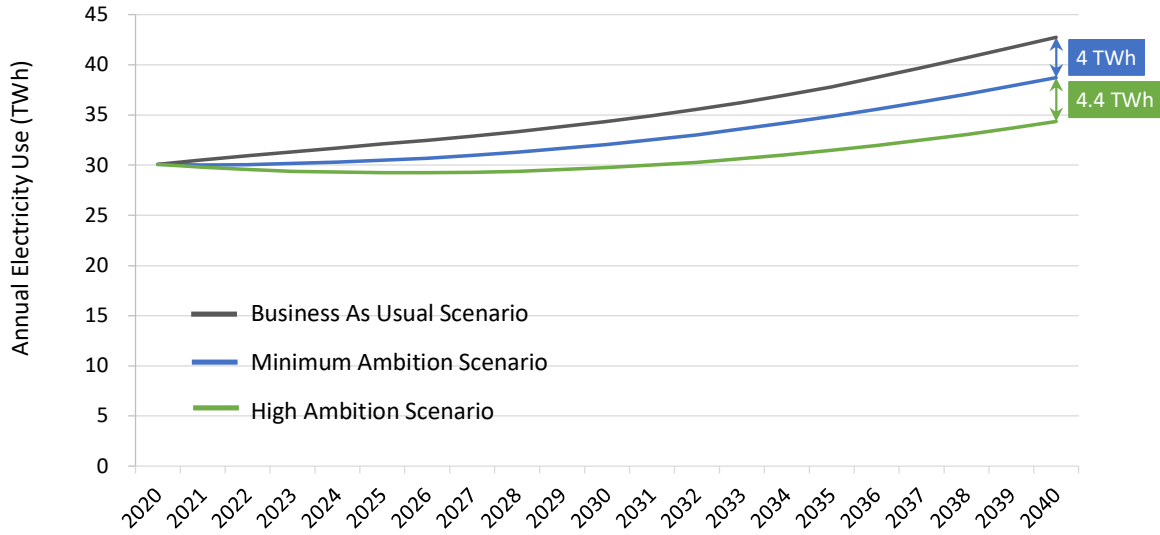

ELECTRICITY SAVINGS OVER TIME*

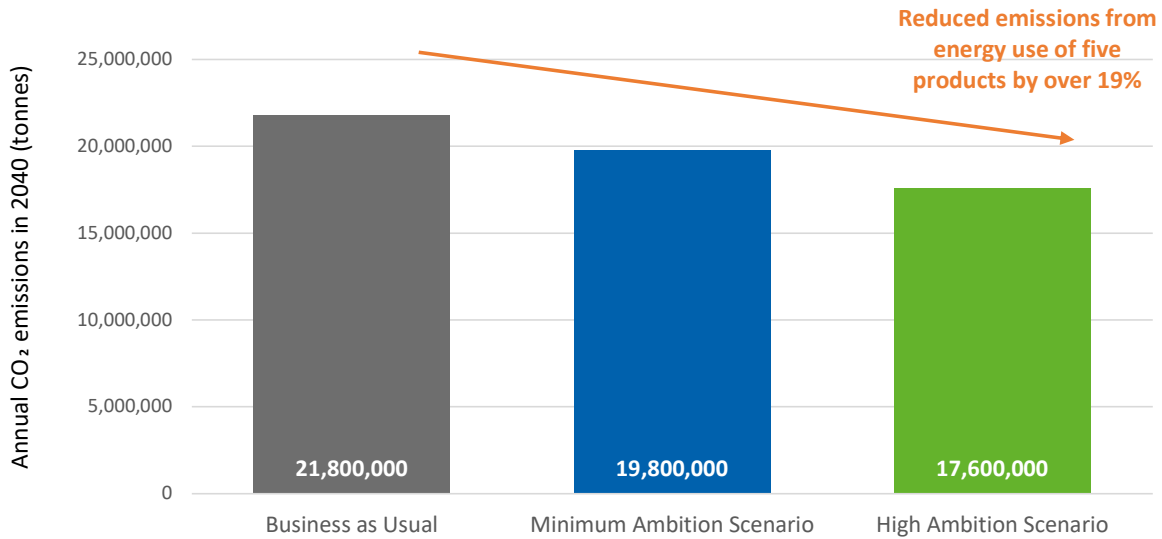

* Denotes savings are from the Minimum Ambition Scenario.
U4E COUNTRY ASSESSMENT, OCTOBER 2020 (UPDATE)

AND EVEN MORE BENEFITS

THE MORE AMBITIOUS THE REGULATION, THE MORE SAVINGS ARE POSSIBLE

MEET GLOBAL CLIMATE GOALS BY SIGNIFICANTLY DECREASED EMISSIONS

OTHER BENEFITS ACHIEVED IN 2030*

Reduced cumulative direct GHG emissions by **180 Thousand tonnes**

* Denotes savings are from the Minimum Ambition Scenario.
U4E COUNTRY ASSESSMENT, OCTOBER 2020 (UPDATE)

DETAILED BENEFITS

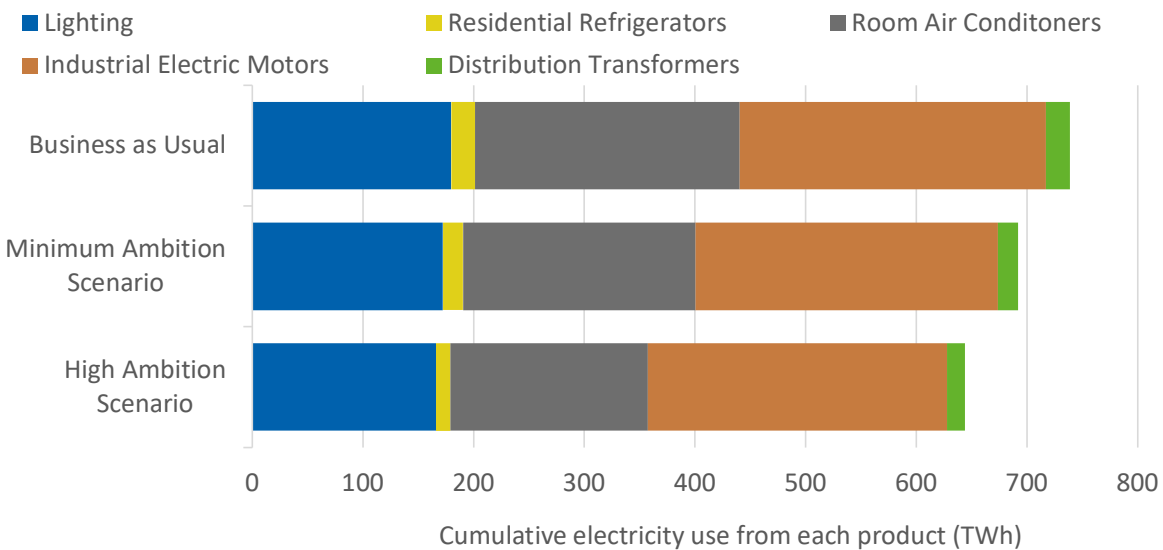

ANNUAL SAVINGS IN 2030 AND 2040*

	Lighting		Cooling				Equipment			
			Residential Refrigerators		Room Air Conditioners		Industrial Electric Motors		Distribution Transformers	
	2030	2040	2030	2040	2030	2040	2030	2040	2030	2040
Electricity (MWh)	510,000	910	160,000	290,000	1,300,000	3,000,000	170,000	380,000	160,000	410,000
Electricity Bills (Thousand US\$)	97,000	170	31,000	55,000	240,000	560,000	32,000	71,000	31,000	77,000
CO2 Emissions (Tonnes)	270,000	480	85,000	150,000	660,000	1,500,000	90,000	200,000	86,000	210,000

CUMULATIVE SAVINGS BY 2030 AND 2040*

	Lighting		Cooling				Equipment			
			Residential Refrigerators		Room Air Conditioners		Industrial Electric Motors		Distribution Transformers	
	2030	2040	2030	2040	2030	2040	2030	2040	2030	2040
Electricity (TWh)	6.5	7.6	0.9	3.3	6.6	29	0.9	3.8	0.9	3.8
Electricity Bills (Million US\$)	1,200	1,400	170	630	1,200	5,400	180	710	160	710
CO2 Emissions (Million tonnes)	3.4	3.9	0.5	1.7	3.4	15	0.5	2.0	0.4	2.0

CONTRIBUTION TO CUMULATIVE ELECTRICITY USE BY 2040

* Denotes savings are from the Minimum Ambition Scenario.
U4E COUNTRY ASSESSMENT, OCTOBER 2020 (UPDATE)

Country Data and Input Assumptions

GENERAL INFORMATION		ELECTRICITY MARKET	
Population	5.79 Million	Residential Electricity tariff	0.19 US\$ / kWh
GDP per capita	64,582 US\$		
Electrification level	100.0%	Transmission and distribution loss factor	2.0%
CO2 Emission Factor	0.51 kg / kWh		

ASSUMPTIONS

	Product	Unit Energy Consumption (kWh/year) or Efficiency Level				Type of Product
		Business As Usual	Minimum Ambition Scenario	High Ambition Scenario		
Lighting	GSL	15W CFL 15	10W LED 10	7W LED 7	800 lumen light bulb: 1,000 hrs/year 4 foot tube: 3,000 hrs/year Poletop street light: 4,380hrs/year	
	Linear	36W T8 108	20W LED 60	16W LED 48		
	HID	70W HPS 307	50W LED 219	40W LED 175		
Cooling	Residential Refrigerators	342	259	129	2-door refrigerator freezer of average size 250 liters	
	Room Air Conditioners	2,682	2,229	1,661	A mix of 3.5 kW and 7 kW split units with a weighted-average cooling capacity of 4.2 kW	
Equipment	Industrial Electric Motors (IEC level)	IE1	IE2	IE3	3-phase induction motors used in the industrial sector	
	Distribution Transformers (Model regulation level)	See note	Level 1	Level 2	Three-phase and single-phase liquid-filled and three-phase dry-type power distribution transformers	

Distribution transformers Note: it is assumed that distribution transformers have losses in line with those assumed in the CENELEC harmonization research for the development of the EU standards.

METHODOLOGY

The analysis uses the UNEP-U4E's Country Savings Assessment Models to estimate the impacts of implementing policies that improve the energy efficiency of each product analysed. The savings potential in each scenario assumes Minimum Energy Performance Standards (MEPS) are introduced in 2020 at two different levels of ambition (minimum and high) as shown above.

ASSUMPTIONS AND DATA SOURCES

- Market size is based on data from industry partners, the UN COMTRADE database and market penetration forecasts generated by U4E Country Savings Assessment Models using data on population, climate, income and other macroeconomic indicators as detailed below.
- Population (2019 and future forecasts) comes from the UN Population Division.
- GDP per capita data (2018) comes from the World Bank with future growth forecasts derived from the IPCC's SSP3 scenario.
- Cooling Degree Days are based on average monthly temperatures from weatherbase.com, degreedays.net or given by wunderground.com.
- Current total electricity consumption comes from the World Bank and the US Energy Information Administration (EIA) with future forecasts derived from the International Energy Agency's (IEA) World Energy Outlook 2018.
- Residential electricity tariffs are based on IEA data.
- Transmission and distribution loss factor is a regional average calculated from electricity production and consumption data published by the IEA.
- Electrification levels come from the IEA's World Energy Outlook 2018 and the World Bank.
- CO2 emission factors come from the IEA and the Institute of Global Environmental Strategies (IGES) and are assumed constant in future years.
- Product typical characteristics are based on analysis from the UNEP-U4E Model Regulation Guidelines and other data from UNEP-U4E industry partners and technical experts including the US Lawrence Berkeley National Laboratory (LBNL), the International Copper Association (ICA) and GIZ.
- The approach of calculating the potential direct emissions saving of refrigerators and air conditioners is based on expert input from GIZ and LBNL.
- Additional to the above sources, a questionnaire was used to gather data from country officials.
- In a small number of instances, additional data was obtained from internet research or by using proxy data from similar markets.

Further details of the modelling approach and assumptions are available on the U4E website. For more information contact: U4E@un.org
